to algebraic geometry, not just for (future) experts in the field. The exposition serves a narrow set of goals (see §0.4), and necessarily takes a particular point of view on the subject. It has now been four decades since David Mumford wrote that algebraic geometry "seems to have acquired the reputation of being esoteric, exclusive, and

MATH 216: FOUNDATIONS OF ALGEBRAIC GEOMETRY

A better description of algebraic geometry is that it is the study of polynomial functions and the spaces on which they are defined (algebraic varieties), just as topology is the study of continuous functions and the spaces on which they are defined (topological spaces),

One of the most exciting new subjects in Algebraic Number Theory and Arithmetic Algebraic Geometry is the theory of Euler systems. Euler systems are special collections of cohomology classes attached to p -adic Galois representations.

Arithmetic Algebraic Geometry: We want to study the properties of the solutions to the polynomial equation $f = 0$ where f is some polynomial defined over Z or Q . We have a hierarchy: Arithmetic Algebraic Geometry is built up through a combination of Algebraic Geometry and Arithmetic. These two areas have commutative algebra, which

1. What is arithmetic geometry? Algebraic geometry studies the set of solutions of a multivariable polynomial equation (or a system of such equations), usually over R or C . For instance, $x^2 + xy + 5y^2 = 1$ defines a hyperbola. It uses both commutative algebra (the theory of commutative rings) and geometric intuition.

algebraic equations define the same affine algebraic variety. Proposition 1.2. Two systems of algebraic equations $S; S_0 \in k[T]$ define the same affine algebraic variety if and only if the ideals (S) and (S_0) coincide. Proof. The part \Leftarrow is obvious.

Looking in positive characteristic for failures of the Bertini-Sard theorem, we determine, up to birational equivalence, the separable proper morphisms of smooth algebraic varieties in characteristic two, whose fibres are non-smooth curves of arithmetic genus two.

Algebraic geometry is a branch of mathematics, classically studying zeros of multivariate polynomials. Modern algebraic geometry is based on the use of abstract algebraic techniques, mainly from commutative algebra, for solving geometrical problems about these sets of zeros.. The fundamental objects of study in algebraic geometry are algebraic varieties, which are geometric manifestations of ...
