In the field of solid mechanics, torsion is the twisting of an object due to an applied torque. Torsion is expressed in newtons per square metre (Pa) or pounds per square inch (psi) while torque is expressed in newton metres (N·m) or foot-pound force (ft·lbf). In sections perpendicular to the torque axis, the resultant shear stress in this section is perpendicular to the radius.

Seismic analysis is a subset of structural analysis and is the calculation of the response of a building (or nonbuilding) structure to earthquakes. It is part of the process of structural design, earthquake engineering or structural assessment and retrofit (see structural engineering) in regions where earthquakes are prevalent.. As seen in the figure, a building has the potential to 'wave' back ...

1. Introduction. A blast generates ground shock and vibration which may cause damage to the surrounding structures. In the recent decades, blast-induced ground shocks and their propagation in rock mass have been drawing more and more attention.
